

How to make my town a greener place.

Coolum beach is a beach site town in Queensland Australia which can become greener by implementing a number of environmental techniques. Firstly, collecting solar energy and storing that in batteries and diverting it back or transforming it back into the main grid. Secondly, by solar heating of water, which is a common practice around the world. Thirdly, and importantly in Coolum, water storage using plastic, concrete or rubber tanks to collect rain water and recycle into the system, the community system. Finally, Coolum is innovative already in clean water collection after storms and storm water run-off. The dryings in Coolum have special ... a special system which works on centrifugal force to collect rubbish in the storm water pits, so the water of the ground of the ocean is clean, fresh water. Behind Coolum, there are sugar cane fields, which are common in Reunion island, **and else sure** the kind that is grown on flatland. It is an area where wind collection and solar collection could be utilized.

*to implement : installer, implanter

*to divert : détourner, dévier

* main grid : reseau électrique

*concrete : du béton

*rubber : du caoutchouc

*the collection : la collection ; la collecte

*a storm : une tempête, un orage

*to run off : s'enfuir ; laisser s'écouler (liquide)

*the drying : le séchage

-> to dry : sécher

-> dry : sec

*the centrifugal force : la force centrifuge

*a pit : un trou, une fosse

*the flatland : le plat pays
